

AstraZeneca + BMS:

where does the portfolio

really collide?

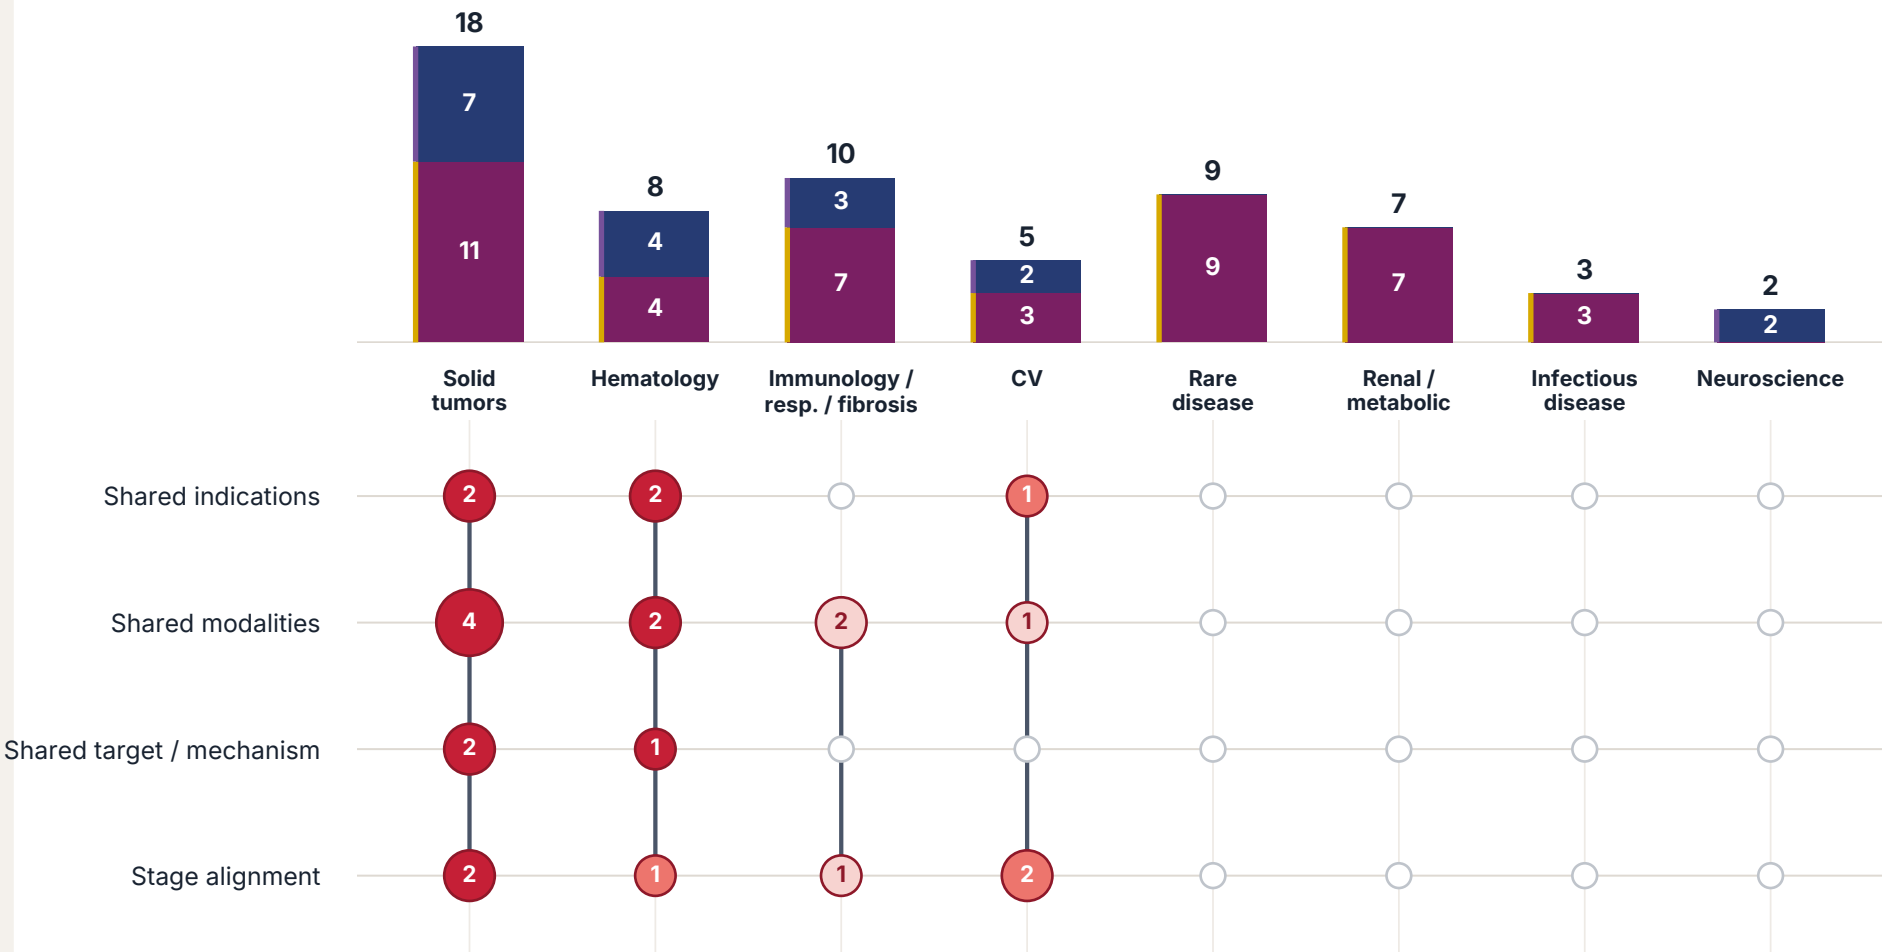

Top bars show each company's late-stage footprint. Bubble size and label show overlap count; red tone shows directness.

Disease areas are columns; portfolio dimensions are rows. Counts are distinct shared territories/classes, not all asset-pair permutations.

LATE-STAGE PROGRAM FOOTPRINT

Unique lead Phase II or Phase III/pivotal/registration assets/programs

Count = distinct shared indication territories, modality classes, target/mechanism themes or stage bands.

WHAT THE CHART SAYS

Oncology has the deepest collision - but the overlap is not equally direct.

Solid tumors share 2 indication territories, 4 modality classes and 2 target/mechanism themes.

Hematology has one exact GPRC5D target overlap. Outside oncology, most overlap is platform or stage adjacency.

Late-stage program = unique lead investigational asset in Phase II or Phase III/pivotal/registration; approved-indication expansions and major lifecycle-management programs excluded.

Overlap units are analyst-normalized from matched Feb 2026 company pipeline disclosures. Counts and evidence are itemized in the backup workbook.
